HOMEWORK 3

Collaborators*: TBD

*Listed in no particular order. And anyone I discussed at least part of one problem with is considered a colaborator.

1: From A&F: 2.2.4.

Let α be a real number. Show that the set of all values of the multivalued function $\log(z^a)$ is not necessarily the same as that of $\alpha \log z$. Solution:

- 2: Describe the Riemann surface on which the multi-valued function w(z), defined by $w^2 = \prod_{j=1}^{n=3} (z a_j)$ is single-valued. What happens for n = 4, 5? For n > 5? You may assume that all the a_j are distinct. Solution:
- **3:** From A&F: 2.2.5a. Derive the following formulae: a)

$$\coth^{-1}(z) = \frac{1}{2}\log\frac{z+1}{z-1}$$

Solution:

We begin with solving for w in $z = \coth w$ with $w, z \in \mathbb{C}$.

$$z = \coth w = \frac{\cosh w}{\sinh w} = \frac{\frac{e^w + e^{-w}}{\frac{d}{d}}}{\frac{e^w - e^{-w}}{\frac{d}{d}}} = \frac{e^w + e^{-w}}{e^w - e^{-w}}$$
$$= \frac{e^w}{e^w} \frac{e^w + e^{-w}}{e^w - e^{-w}} = \frac{e^{2w} + 1}{e^{2w} - 1}$$

Now let's proceed by multiplying both sides by the denominator

$$\begin{split} z\left(e^{2w}-1\right) &= e^{2w}+1 \\ ze^{2w}-z &= e^{2w}+1 \\ ze^{2w}-e^{2w} &= z+1 \\ e^{2w}(z-1) &= z+1 \\ e^{2w} &= \frac{z+1}{z-1} \\ \log\left(e^{2w}\right) &= \log\left(\frac{z+1}{z-1}\right) + 2i\pi k, \ k \in \mathbb{Z} \\ 2w &= \log\left(\frac{z+1}{z-1}\right) + 2i\pi k, \ k \in \mathbb{Z} \\ w &= \frac{1}{2}\log\left(\frac{z+1}{z-1}\right) + i\pi k, \ k \in \mathbb{Z} \end{split}$$

This is to show

$$\coth^{-1}(z) = \operatorname{arccot}(\coth w) = w = \frac{1}{2}\log\left(\frac{z+1}{z-1}\right) + i\pi k, \ k \in \mathbb{Z}.$$

More directly we have

$$\coth^{-1}(z) = \frac{1}{2}\log\left(\frac{z+1}{z-1}\right) + i\pi k, \ k \in \mathbb{Z}.$$

as required. **TODO:** determine what your choice of k should be b)

$$\operatorname{sech}^{-1}(z) = \log \left(\frac{1 + (1 - z^2)^{\frac{1}{2}}}{z} \right)$$

Solution:

We begin with solving for w in $z = \operatorname{sech} w$ with $w, z \in \mathbb{C}$.

$$z = \operatorname{sech} w = \frac{1}{\cosh w} = \frac{1}{\frac{e^w + e^{-w}}{2}} = \frac{2}{e^w + e^{-w}}$$
$$= \frac{e^w}{e^w} \frac{2}{e^w + e^{-w}} = \frac{2e^w}{e^{2w} + 1}$$

Now let's proceed by multiplying both sides by the denominator

$$z(e^{2w} + 1) = 2e^{w}$$
$$ze^{2w} + z = 2e^{w}$$
$$ze^{2w} - 2e^{w} + z = 0$$

We now use the quadratic formula to solve for e^w

$$e^{w} = \frac{2 + (4 - 4z^{2})^{\frac{1}{2}}}{2z}$$

$$e^{w} = \frac{\cancel{2} + \cancel{2} (1 - z^{2})^{\frac{1}{2}}}{\cancel{2}z}$$

$$\log e^{w} = \log \left(\frac{1 + (1 - z^{2})^{\frac{1}{2}}}{z}\right) + 2i\pi k, \ k \in \mathbb{Z}$$

$$w = \log \left(\frac{1 + (1 - z^{2})^{\frac{1}{2}}}{z}\right) + 2i\pi k, \ k \in \mathbb{Z}$$

This is to show

$$\operatorname{sech}^{-1}(z) = \operatorname{sech}^{-1}(\operatorname{sech} w) = w = \log\left(\frac{1 + (1 - z^2)^{\frac{1}{2}}}{z}\right) + 2i\pi k, \ k \in \mathbb{Z}.$$

More directly we have

$$\operatorname{sech}^{-1}(z) = \log \left(\frac{1 + (1 - z^2)^{\frac{1}{2}}}{z} \right) + 2i\pi k, \ k \in \mathbb{Z}.$$

as required. **TODO:** determine what your choice of k should be and how to denote the related cuts made for the $\sqrt{\cdot}$ function.

While you're at it, also derive a formula for $\operatorname{arccot}(z)$ in terms of the logarithm. Solution:

Let's begin by solving for w in this equation $z = \cot w$ with $w, z \in \mathbb{C}$.

$$z = \cot w = \frac{\cos w}{\sin w} = \frac{\frac{e^{iw} + e^{-iw}}{2}}{\frac{e^{iw} - e^{-iw}}{2}} = \frac{i\left(e^{iw} + e^{-iw}\right)}{e^{iw} - e^{-iw}}$$
$$= \frac{e^{iw}}{e^{iw}} \frac{i\left(e^{iw} + e^{-iw}\right)}{e^{iw} - e^{-iw}} = \frac{i\left(e^{2iw} + 1\right)}{e^{2iw} - 1}$$

Now let's proceed by multiplying both sides by the denominator

$$z(e^{2iw} - 1) = i\left(e^{2iw} + 1\right)$$

$$ze^{2iw} - z = ie^{2iw} + i$$

$$ze^{2iw} - z - ie^{2iw} - i = 0$$

$$e^{2iw}(z - i) = z + i$$

$$e^{2iw} = \frac{z + i}{z - i}$$

$$\log\left(e^{2iw}\right) = \log\left(\frac{z + i}{z - i}\right) + 2i\pi k, \ k \in \mathbb{Z}$$

$$2iw = \log\left(\frac{z + i}{z - i}\right) + 2i\pi k, \ k \in \mathbb{Z}$$

$$w = \frac{1}{2i}\log\left(\frac{z + i}{z - i}\right) + \pi k, \ k \in \mathbb{Z}$$

This is to show

$$\operatorname{arccot}(z) = \operatorname{arccot}(\cot w) = w = \frac{1}{2i} \log \left(\frac{z+i}{z-i}\right) + \pi k, \ k \in \mathbb{Z}.$$

More directly we have

$$\operatorname{arccot}(z) = \frac{1}{2i} \log \left(\frac{z+i}{z-i} \right) + \pi k, \ k \in \mathbb{Z}$$

as required. **TODO:** determine what your choice of k should be

4: Let

$$s(z) = z^{1/2} = \rho^{1/2} e^{i\theta/2}, \quad \theta \in [-\pi, \pi),$$

denote the principal branch of the square root. Show that the functions

$$f_1(z) = s(z^2 - 1), \quad f_2(z) = s(z - 1)s(z + 1),$$

are not equal as functions on \mathbb{C} — first produce plots and then use a mathematical argument. Determine the branch cut for $f_2(z)$ (Note: My cartoon of what the branch cut for f_1 looks like in lecture was not accurate). Find the relationship between $f_1(z)$ and $f_2(z)$.

Solution:

5: Consider the function

$$\psi(z) = \int_1^z \frac{\mathrm{d}w}{(w^2 - 1)^{1/2}}, \quad z \notin (-\infty, 1),$$

where the path of integration is a straight line from 1 to z.

• Show that

$$\psi(z) = \log \varphi(z), \quad \varphi(z) = z + (z^2 - 1)^{1/2}, \quad z \notin (-\infty, 1),$$

for an appropriate choice of branch cut for $(z^2 - 1)^{1/2}$. Here $\log z$ denotes the principal branch.

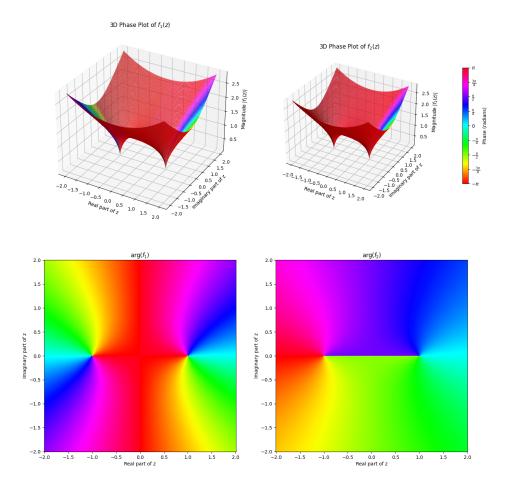

Figure 1. Plot $|f_{\epsilon}(z)| = \left|\frac{\epsilon}{\epsilon^2 + z^2}\right|$, for various values of ϵ .

• Find an expression for

$$\gamma(z) = \int_{-1}^{z} \frac{\mathrm{d}w}{(w^2 - 1)^{1/2}}, \quad z \notin (-1, \infty),$$

in terms of $\varphi(z)$ and the principal branch of the logarithm. Again, the path of integration is a straight line. Solution:

6: Show that φ , from the previous problem, maps $\mathbb{C} \setminus [-1,1]$ onto the exterior of the unit disk, $\{z \in \mathbb{C} : |z| > 1\}$. Furthermore

$$\frac{1}{2}\left(\varphi(z)+1/\varphi(z)\right)=z,\quad \mathbb{C}\setminus[-1,1].$$

Solution:

7: (Sharpness of the Bernstein–Walsh inequality) The Bernstein–Walsh inequality states that if a polynomial p_n of degree n satisfies $\max_{-1 \le x \le 1} |p_n(x)| \le 1$ then

$$|p_n(z)| \le |\varphi(z)|^n, \quad z \in \mathbb{C} \setminus [-1, 1].$$

Show that

$$T_n(z) = \frac{1}{2} \left(\varphi(z)^n + \varphi(z)^{-n} \right), \quad z \in \mathbb{C} \setminus [-1, 1]$$

is a polynomial that satisfies

$$\max_{-1 \le x \le 1} |T_n(x)| = 1,$$

$$\lim_{n \to \infty} |T_n(z)|^{1/n} = |\varphi(z)|,$$

for any fixed $z \in \mathbb{C} \setminus [-1, 1]$.

Solution:
